

FIRST CUSTOMER MEETING FEEDBACK REPORT

This document intend to make sure that we (Destiny Tech) and the client (Classic Store) come to a common understanding on what should be done on the project that is about to comense as soon as we both parties will be ready to proceed with the project.

The following is a short brief of what will be done by us (Destiny Tech) on implementing the first version of the system

1. USERS OF THE SYSTEM

There are three main users

1.1. Super Admin

1.2. Store keeper

1.3. Shop keepers

1.1 Super admin

- Will be able to do all the functionalities of the Store keeper and shop keeper
- Will be able to add new store keepers & shop keepers and assigning them their roles and full information
- Will be able to delete users (store keepers and shop keepers)
- Will be the one to view all whats going on in the system and will have the highest privilege in the system
- Will be able to view store orders (to and from the store)
- Will be able to view bulk orders (will be explained later in this document)

1.2 Store keeper

- This will be the one responsible to run all the store activities
- Receive store orders and bulk orders from the shop keepers
- Add new stocks in the stores

1.3 Shop keepers

- Make orders to the store both bulk and store orders
- Change order types from unpaid to paid or incomplete

2. PRODUCTS AND PRODUCTS CATEGORIES

2.1 PRODUCTS

Currently the system will have two kind of products

1.phone covers

2.phone protectors

2.2 PRODUCT CATEGORIES

Products will be categorized in three phases

A main Category will have a sub category and a sub category will have a sub sub category

i.e PHONE PROTECTORS as a main category will have a sub category of 21D , And 21D will have a sub category of iphone 11

NB: iphone 11 21D covers will have their own numbers so iphone 11 21D wont be mixed with other type of iphone 11 covers for the accuracy of data

3.SHOPS AND STORES AND HOW TO INTERGRATE

Currently there are two shops that will be sharing one store but the store has three locations , so it is suggested that the super admin will be able to add a new location of a store (since there are plans to add new locations of the store)

NB: Products won't be mixed a single product won't be in multiple locations i.e iphone 11 , 21D protectors will only be found in location 1

4.ORDERS THAT WILL BE DONE IN THE SYSTEM

There are two kinds of orders that will be done in the system

i. Store orders

These are the orders that will be made by the shop keepers (usually done in the morning to restock the stock in the shop)

ii. Bulk orders

These are the orders that will be done in the mid day, usually these orders are done from neighboring storesand most of the time these orders are not paid in cash , so they will have the following details

1. Order from:

2. Name:

3. Products i.e 200 21D iphone 11

3.1 From shop 100

3.2 From store : if there are the ones to be taken from the store then he will be prompted to write type of product according to its category and sub and sub category and this order will be separately sent as a bulk order to the store keeper

4. PAID/ UNPAID / INCOMPLETE (If it is a paid order then it will appear as a paid order to the admin if its unpaid then it will appear so ,or if its an incomplete the user will be able to write the remaining amount to be paid and the amount paid , but also there will be an option to change status of the orders from unpaid to paid or unpaid to incomplete

5. WHAT WILL THE SYSTEM DO?

The version one of the system will be a Stock management system that will be added some features to make it work accordingly to what the client(Classic Store) wishes it to operate.

The system will be an online store that will have a domain and hosted in a cloud server.

It will be an online store of everything that will be found in the physical stores at Kariakoo.

IN THE SYSTEM

When a new stock comes the Store keeper will be able to add the stocks according to category and sub category as the new stock will come from the supplier.

The shop keeper will order store orders and bulk order direct to the store keeper and the store keeper will be able to accept orders or reject orders if the order can not be delivered and once the store keeper will accept then automatically the system will reduce the number of products from the database.

The shop keeper will also be able to change the status of the bulk orders from Unpaid to paid and unpaid to incomplete.

The super admin will be able to view different reports from daily , to monthly will be able to see what was done on shop 1 on shop 2 but also individually who did what and when .But also he can view the orders store orders but also the bulk orders that will have the status of the order if it is paid unpaid and incomplete.

And there will be availability of low stock alerts and best ordered products in the admin panel.

6. TIMELINE

The client would like to have the complete working system before 29/5/2026
